

Internship Report Presentation

Web Development with HTML/CSS

Palak Singh · July · August 2026

Entrevescence, IIIT-Allahabad · *Powered by EngineerCore*

CANDIDATE PROFILE

About the Student

- **Name:** Palak Singh
- **Internship Domain:** Web Development with HTML/CSS
- **Training Duration:** July · August 2026
- **Organization:** Entrevescence, IIIT-Allahabad
- **Powered by:** EngineerCore

Web Development with HTML & CSS

Web development is the process of creating websites and web applications that people access through a browser. The internship focused on front-end development, using HTML for structure and CSS for presentation.

HTML — Structure

HTML defines the content and meaning of a webpage using headings, paragraphs, links, images, lists, tables and forms.

CSS — Presentation

CSS controls visual appearance and layout, including typography, spacing, colors, borders and responsive arrangements.

Browser — Output

The browser interprets HTML and CSS and renders the result. Developers test pages at different sizes and states.

Learning objectives

- Understand webpage structure before styling it.
- Separate content and semantics from presentation.
- Build clean pages that work across common screen sizes.

Building the Structure of a Webpage

HTML (HyperText Markup Language) provides the structural foundation of a website. Good HTML uses meaningful elements so browsers and assistive technologies can understand how the content is organized.

Document Structure

DOCTYPE, html, head and body establish the basic document framework. Metadata and page content stay in their appropriate sections.

Semantic Elements

header, nav, main, section, article and footer communicate the role of content instead of relying only on generic containers.

Content & Links

Headings, paragraphs, lists, images and hyperlinks organize information and help users move through a site.

Important practice areas

- Use headings in a logical hierarchy.
- Add useful alternative text for informative images.
- Use links for navigation and buttons for actions.
- Keep HTML source readable and logically ordered.

Styling, Spacing and Visual Design

CSS (Cascading Style Sheets) is used to style and lay out HTML content. It controls typography, colors, spacing, borders, sizing and positioning without changing the underlying meaning of the HTML.

Selectors

Selectors choose which HTML elements receive a style. Declarations contain properties and values that define the visual result.

Box Model

Margin, border, padding and content determine how an element occupies space and help explain common sizing issues.

Layout

Modern CSS uses tools such as Flexbox and Grid to align, distribute and organize page content.

Common CSS concepts practiced

- Colors, fonts and text formatting
- Backgrounds, borders and border-radius
- Margin, padding and sizing
- Width, height and overflow
- Layout using Flexbox and Grid

Flexbox, Grid and Responsive Design

Modern CSS provides layout systems that help developers create flexible interfaces. Flexbox is primarily one-dimensional, while Grid supports two-dimensional layouts. Responsive design combines these tools with flexible sizing and media queries.

Flexbox

Useful for arranging items in rows or columns, aligning content, distributing space and allowing items to wrap.

CSS Grid

Useful for two-dimensional page sections where content needs to be organized into rows and columns.

Media Queries

Allow CSS rules to change when viewport or device conditions meet specified rules, supporting responsive layouts.

Responsive design checklist

- Use a viewport meta tag for mobile rendering.
- Avoid fixed-width layouts that force horizontal scrolling.
- Test navigation, text, images and forms on narrow and wide screens.
- Keep logical reading order consistent with the HTML source.

Navigation, Forms and Accessibility

A useful webpage must not only look good; it should also be easy to navigate and interact with. HTML provides native links, buttons and form controls, while CSS can make these controls clear and consistent.

Navigation

Use clear link text and a consistent navigation structure so users understand where each link will take them.

Forms

Forms collect information through labels, inputs, selects, textareas and buttons. Correct structure improves usability.

Accessibility

Semantic elements, labels, keyboard-friendly controls and logical source order help more users interact with the page.

Practical checks

- Every form control should have an understandable label.
- Use native HTML controls where they already provide the required behavior.
- Check keyboard focus and tab order.
- Keep headings and content in a logical sequence.

Coding, Testing and Debugging

Web development is iterative. A page is built, viewed in a browser, tested, adjusted and tested again. Browser developer tools help inspect HTML and CSS, understand computed styles and identify layout problems.

01

Plan

Decide the purpose, content sections and basic layout.

02

Build

Write semantic HTML and connect the CSS stylesheet.

03

Style

Apply typography, spacing, colors and layout rules.

04

Inspect

Use developer tools to inspect elements and applied CSS.

05

Test

Check links, forms, layout and responsive behavior.

06

Refine

Fix errors, improve consistency and repeat the test cycle.

Mini Project: Responsive Personal Website

A simple responsive personal website can combine the main skills learned during the internship. The project demonstrates how structure, styling, navigation, forms and responsive layout work together.

Home

Introduction, short profile and a clear first impression of the website.

About

Education, interests and a concise description of the student.

Skills / Projects

A structured presentation of technical skills and completed work.

Contact

A simple accessible form with labels, inputs and a submit action.

Expected result

- Clean semantic HTML structure with meaningful sections.
- Consistent CSS styling and reusable layout rules.
- Responsive behavior for desktop, tablet and mobile widths.
- Clear navigation and usable contact form.
- Testing and debugging using browser developer tools.

CERTIFICATE

OF COMPLETION

Palak Singh

is presented with this certificate to acknowledge their active participation in

Web Development with HTML/CSS

Course with **Engineer Core Features** organized in association with **Entrevescence of IIIT-Allahabad**
in the month of **July and August 2026**

Program

Skills Developed During the Internship

The training provides a practical foundation for front-end development. The key outcome is learning how to move from a webpage idea to a structured, styled and tested result.

HTML

Create structured documents using semantic elements, headings, links, images, lists and forms.

CSS

Apply selectors, typography, spacing, backgrounds, borders and layout rules.

Responsive Design

Adapt layouts to different viewport sizes using flexible layout methods and media queries.

Accessibility

Use semantic HTML, labels, native controls and logical document order.

Debugging

Inspect elements and styles with browser tools and correct HTML/CSS problems.

Professional Practice

Organize files clearly, test changes frequently and improve the interface through iteration.

Reference: MDN HTML, CSS, responsive design, accessibility and debugging guidance.

Conclusion and Future Scope

The internship strengthened the basic skills required to begin front-end web development. HTML was used to organize content and define meaning, while CSS was used to control appearance and layout. Responsive design and accessibility added a practical focus beyond simply making a page look attractive.

What I Learned

How to plan a page, write semantic HTML, style it with CSS, create responsive layouts, build forms and inspect problems in the browser.

What I Can Build

A clean multi-section webpage with navigation, images, content sections, a contact form and responsive behavior.

Next Step

Strengthen JavaScript and then explore component-based development, APIs and full-stack web development.
